

ABSTRACT OF THE DISCLOSURE

A chafer comprising a support frame, a food service pan, a cover, a cover pivoting assembly, a cover mounting assembly and a cover damper assembly. The cover has a peripheral edge and is pivotably mounted on the support frame by the cover pivoting assembly. The support frame supports the pan under the cover. The cover mounting assembly releasably mounts the cover to the cover pivoting assembly to enable the cover to be pivoted about a horizontal axis from a fully closed position to an intermediate, partially open position and to a fully open position, and vice versa. The cover is arranged to be automatically held in the fully closed, partially open or fully open positions by the mere movement of the cover to any of those positions.

100% of the time, the cover is held in the closed, partially open or fully open positions.
